Audit Updates

Initial Audit	25th October 2022
Corrected	

Contract Analysis

● Critical ● Medium ● Minor / Informative ● Pass

Severity	Code	Description	Status
●	ST	Stops Transactions	Unresolved
●	OCTD	Transfers Contract's Tokens	Unresolved
●	OTUT	Transfers User's Tokens	Passed
●	ELFM	Exceeds Fees Limit	Unresolved
●	ULTW	Transfers Liquidity to Team Wallet	Unresolved
●	MT	Mints Tokens	Passed
●	BT	Burns Tokens	Passed
●	BC	Blacklists Addresses	Unresolved

ST - Stops Transactions

Criticality	critical
Location	contract.sol#L1291
Status	Unresolved

Description

The contract owner has the authority to stop the sales for all users excluding the owner. The owner may take advantage of it by setting the sell fees to 100%. As a result, the contract may operate as a honeypot. Additionally, the owner may take advantage of it by setting the `_maxTxAmount` to zero or by calling the function `openTrade` with the argument value to false.

```
function _transfer(
        address from,
        address to,
        uint256 amount
    ) private open(from, to){
        require(from != address(0), "ERC20: transfer from the zero address");
        require(to != address(0), "ERC20: transfer to the zero address");
        require(!_isBlacklisted[from] && !_isBlacklisted[to], "This address is blacklisted");
        require(amount > 0, "Transfer amount must be greater than zero");
        if (from != owner() && to != owner()) {
            require( _isExcludedFromMaxTnxLimit[from] || _isExcludedFromMaxTnxLimit[to] ||
             amount <= _maxTxAmount,
                "Transfer amount exceeds the maxTxAmount."
            );
        }
        //....
        if (from == uniswapV2Pair) {
                // Buy
                _taxFee = _buyTaxFee;
                _marketingFee = _buyMarketingFee;
                _charityFee = _buyCharityFee;
         } else if (to == uniswapV2Pair) {
                // Sell
                _taxFee = _sellTaxFee;
                _marketingFee = _sellMarketingFee;
                _charityFee = _sellCharityFee;
        }
```

Recommendation

The contract could embody a check for not allowing setting the _maxTxAmount less than a reasonable amount. A suggested implementation could check that the maximum amount should be more than a fixed percentage of the total supply.

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

OCTD - Transfers Contract's Tokens

Criticality	minor / informative
Location	contract.sol#L1090
Status	Unresolved

Description

The contract owner has the authority to claim all the balance of the contract. The owner may take advantage of it by calling the withdrawStuckedTokens function.

```
  function withdrawStuckedTokens(address tokenAddress, uint256 tokens) external onlyOwner
returns (bool success){
        return IERC20(tokenAddress).transfer(msg.sender, tokens);
    }
```

Recommendation

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

ELFM - Exceeds Fees Limit

Criticality	critical
Location	contract.sol#L1016,1032
Status	Unresolved

Description

The contract owner has the authority to increase over the allowed limit of 25%. The owner may take advantage of it by calling the setSellFeePercent and setBuyFeePercent functions with a high percentage value.

```
function setSellFeePercent(
    uint256 tFee, uint256 mFee, uint256 cFee, uint256 bFee
) external onlyOwner {
    _sellTaxFee = tFee;
    _taxFee = _sellTaxFee;
    _sellMarketingFee = mFee;
    _marketingFee = _sellMarketingFee;
    _sellCharityFee = cFee;
    _charityFee = _sellCharityFee;
    _sellBurnFee = bFee;
    _burnFee = _sellBurnFee;
}

function setBuyFeePercent(
    uint256 tFee,  uint256 mFee, uint256 cFee, uint256 bFee
) external onlyOwner {
    _buyTaxFee = tFee;
    _taxFee = _buyTaxFee;
    _buyMarketingFee = mFee;
    _marketingFee = _buyMarketingFee;
    _buyCharityFee = cFee;
    _charityFee = _buyCharityFee;
    _buyBurnFee = bFee;
    _burnFee = _buyBurnFee;
}
```

Recommendation

The contract could embody a check for the maximum acceptable value.

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

ULTW - Transfers Liquidity to Team Wallet

Criticality	minor / informative
Location	contract.sol#L1083
Status	Unresolved

Description

The contract owner has the authority to transfer funds without limit to the team wallet. These funds have been accumulated from fees collected from the contract. The owner may take advantage of it by calling the `method1` and `method2` methods.

```
function withdrawStuckedFunds(uint256 amount) external onlyOwner {
        // This is the current recommended method to use.
        (bool sent, ) = _owner.call{value: amount}("");
        require(sent, "Failed to send ETH");
}
```

Recommendation

The contract could embody a check for the maximum amount of funds that can be swapped. Since a huge amount may volatile the token's price.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

BC - Blacklists Addresses

Criticality	medium
Location	contract.sol#L1010
Status	Unresolved

Description

The contract owner has the authority to stop addresses from transactions. The owner may take advantage of it by calling the addToBlackList function.

```
function addToBlackList(address account) external onlyOwner {
 require(account != owner(),"Owner address can not blacklisted");
 _isBlacklisted[account] = true;
 }
```

Recommendation

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

Critical Medium Minor / Informative

Severity	Code	Description	Status
●	STC	Succeeded Transfer Check	Unresolved
●	BLC	Business Logic Concern	Unresolved
●	MC	Missing Check	Unresolved
●	L02	State Variables could be Declared Constant	Unresolved
●	L04	Conformance to Solidity Naming Conventions	Unresolved
●	L05	Unused State Variable	Unresolved
●	L07	Missing Events Arithmetic	Unresolved
●	L09	Dead Code Elimination	Unresolved
●	L13	Divide before Multiply Operation	Unresolved

STC - Succeeded Transfer Check

Criticality	minor / informative
Location	contract.sol#L1091
Status	Unresolved

Description

According to the ERC20 specification, the transfer methods should be checked if the result is successful. Otherwise, the contract may wrongly assume that the transfer has been established.

```
function withdrawStuckedTokens(address tokenAddress, uint256 tokens) external onlyOwner
returns (bool success){
        return IERC20(tokenAddress).transfer(msg.sender, tokens);
    }
```

Recommendation

The contract should check if the result of the transfer methods is successful.

BLC - Business Logic Concern

Criticality	minor / informative
Location	contract.sol#L1364
Status	Unresolved

Description

In Solidity, all integer division rounds down to the nearest integer. The contract distributes the funds proportional to the receipients. These calculations may produce unexpected left-over funds to the contract.

```
uint256 ethForMarketing = ethBalance * marketingTokens / (totalTokensToSwap);
uint256 ethForCharity = ethBalance * charityTokens / (totalTokensToSwap);
(success,) = address(_marketingWalletAddress).call{value: ethForMarketing}("");
(success,) = address(_CharityWalletAddress).call{value: ethForCharity}("");
```

Recommendation

In the last ratio, the contract could subtract the sum of the rest ratios from the totalTokensToSwap. Hence, it will be guaranteed that the calculations will not produce leftover amounts.

MC - Missing Check

Criticality	minor / informative
Location	contract.sol#L1048,1052
Status	Unresolved

Description

The contract is processing variables that have not been properly sanitized and checked that they form the proper shape. These variables may produce vulnerability issues.

The contract does not sanitize the address properly.

```
function setMarketingWalletAddress(address _addr) external onlyOwner {
    _marketingWalletAddress = _addr;
}

function setCharityWalletAddress(address _addr) external onlyOwner {
    _CharityWalletAddress = _addr;
}
```

Recommendation

The contract should properly check the variables according to the required specifications. It is recommended to embody a check for not allowing addresses to be set to zero.

L02 - State Variables could be Declared Constant

Criticality	minor / informative
Location	contract.sol#L296,716,725
Status	Unresolved

Description

Constant state variables should be declared constant to save gas.

```
_previousOwner
_burnAddress
_totalFees
```

Recommendation

Add the constant attribute to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality	minor / informative
Location	contract.sol#L1236,743,726,421,452,350,419,716,741,295,1048,714,711,1240,1074,1248,715,742,498,1052,740,755
Status	Unresolved

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow _ at the beginning of the mixed_case match for private variables and unused parameters.

```
_amount
_burnFee
_maxTxAmount
PERMIT_TYPEHASH
MINIMUM_LIQUIDITY
_users
DOMAIN_SEPARATOR
_burnAddress
_marketingFee
...
```

Recommendation

Follow the Solidity naming convention.
https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions.

L05 - Unused State Variable

Criticality	minor / informative
Location	contract.sol#L725,296
Status	Unresolved

Description

There are segments that contain unused state variables.

```
_totalFees
_previousOwner
```

Recommendation

Remove unused state variables.

L07 - Missing Events Arithmetic

Criticality	minor / informative
Location	contract.sol#L1016,1056,1060,1032
Status	Unresolved

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
_sellTaxFee = tFee
_maxTxAmount = maxTxAmount * 10 ** decimals()
numTokensSellToSendFees = amount * 10 ** _decimals
_buyTaxFee = tFee
```

Recommendation

Emit an event for critical parameter changes.

L09 - Dead Code Elimination

Criticality	minor / informative
Location	contract.sol#L171,198,264,252,212,229,274,163,190,242,183
Status	Unresolved

Description

Functions that are not used in the contract, and make the code's size bigger.

```
sendValue
functionCallWithValue
functionDelegateCall
functionStaticCall
_verifyCallResult
isContract
functionCall
...
```

Recommendation

Remove unused functions.

L13 - Divide before Multiply Operation

Criticality	minor / informative
Location	contract.sol#L1348
Status	Unresolved

Description

Performing divisions before multiplications may cause lose of prediction.

```
charityTokens = contractBalance.mul(_charityFee).div(100)
marketingTokens = contractBalance.mul(_marketingFee).div(100)
```

Recommendation

The multiplications should be prior to the divisions.

Summary

There are some functions that can be abused by the owner like stopping transactions, transferring the user's tokens, manipulating fees, transferring funds to the team’s wallet, and blacklisting addresses. The contract can be converted into a honeypot and prevent users from selling if the owner abuses the admin functions. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.

The Cyberscope team
