Introduction

The TokenSwap contract core functionality is to swap two tokens. The contract is operating as a wrapper between the client and the DEX router. The TokenSwap transfers the tokens temporarily to the contract until the transaction is finished. The swap operation can only be applied by the pool role. The pool role can only be set by the contract owner.

Contract Diagnostics

Critical Medium Minor

Severity	Code	Description
	OCTD	Contract Owner is not able to transfer tokens from specific address
	CR	Code Repetition
	L04	Conformance to Solidity Naming Conventions
	L06	Missing Events Access Control

OCTD - Owner Contract Tokens Drain

Criticality	minor
Location	contract.sol#L42

Description

The contract owner has the authority to claim all the balance of the contract. The owner may take advantage of it by calling the adminWithdraw function.

```
function adminWithdraw(address token, uint256 amount) external onlyOwner {
        require(IERC20(token).balanceOf(address(this)) >= amount, "Amount too high");
        IERC20(token).safeTransfer(msg.sender, amount);
}
```

Recommendation

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

CR- Code Repetition

Criticality	minor
Location	contract.sol#L47,L71

Description

There are code segments that are repetitive in the contract. Those segments increase the code size of the contract unnecessarily.

```
path[0] = token1;
path[1] = token2;
IERC20(token1).safeTransferFrom(msg.sender, address(this), amount);
IERC20(token1).approve(router, amount);
.
.
.
uint256 token1Amount = IERC20(token1).balanceOf(address(this));
uint256 token2Amount = IERC20(token2).balanceOf(address(this));
if (token1Amount > 0) {
    IERC20(token1).safeTransfer(msg.sender, token1Amount);
}
if (token2Amount > 0) {
    IERC20(token2).safeTransfer(msg.sender, token2Amount);
}
emit SwapExact(token1, token2, amount);
```

Recommendation

Create an internal function that contains the code segment and remove it from all the sections.

L04 - Conformance to Solidity Naming Conventions

Criticality	minor
Location	contracts/TokenSwap.sol#L33,38

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow _ at the beginning of the mixed_case match for private variables and unused parameters.

```
_router
_pool
```

Recommendation

Follow the Solidity naming convention.
https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions.

L06 - Missing Events Access Control

Criticality	minor
Location	contracts/TokenSwap.sol#L33

Description

Detected missing events for critical access control parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
pool = _pool
```

Recommendation

Emit an event for critical parameter changes.

Contract Functions

Registrar IANA ID	1068

The domain was created 8 months before the creation of the audit.

There is no public billing information, the creator is protected by the privacy settings.

Summary

The TokenSwap operates as a wrapper between the user and the exchange router. It does not keep fees, thus the ‘adminWithdraw’ method is safe. This audit investigates the security aspects and mentions some potential improvements.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.
