Audit Updates

Initial Audit	25th July 2022
Corrected	1st August 2022

Contract Analysis

Critical Medium Minor Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

ST - Stop Transactions

Criticality	critical
Location	contract.sol#L757,L760,L787

Description

The contract owner has the authority to stop transactions for all users excluding the owner. The owner may take advantage of it by setting the antiBotAmount to zero and by setting the antiBotDuration to maximum amount.

```
if ((sender == pair) || (recipient == pair)) {
    if (!isAntiBotEnded())
    {
        if (!(addLPaddress[sender] || addLPaddress[recipient]))
                { require(amount <= antiBotAmount, "antiBot"); }
    }
}
```

The contract owner can also turn the contract to honey by setting sell fees to maximum amount with the function setFee.

```
 if (recipient == pair) {
            _liquidityFee = sellLiquidityFee;
            _treasuryFee = sellTreasuryFee;
            _tedRiskFreeValueFee = sellTedRiskFreeValueFe;
}
```

Recommendation

The contract could embody a check for not allowing setting the antiBotAmount, antiBotDuration and the sell fees less than a reasonable amount. A suggested implementation could check that the maximum amount should be more than a fixed percentage of the total supply. In addition, the anti-bot duration should be restricted to a reasonable amount.

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user

from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

ELFM - Exceed Limit Fees Manipulation

Criticality	critical
Location	contract.sol#L787

Description

The contract owner has the authority to increase over the allowed limit of 25%. The owner may take advantage of it by calling the setTaxFeePercent function with a high percentage value.

```
function setFee(
        uint256 firePitFee_,
        uint256 sellLiquidityFee_,
        uint256 sellTreasuryFee_,
        uint256 sellTedRiskFreeValueFee,
        uint256 buyLiquidityFee_,
        uint256 buyTreasuryFee_,
        uint256 buyTedRiskFreeValueFee_
    ) external onlyOwner {
        firePitFee = firePitFee_;
        sellLiquidityFee = sellLiquidityFee_;
        sellTreasuryFee = sellTreasuryFee_;
        sellTedRiskFreeValueFe = sellTedRiskFreeValueFee;
        buyLiquidityFee = buyLiquidityFee_;
        buyTreasuryFee = buyTreasuryFee_;
        buyTedRiskFreeValueFee = buyTedRiskFreeValueFee_;
}
```

Recommendation

The contract could embody a check for the maximum acceptable value.

The team should carefully manage the private keys of the owner’s account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

ULTW - Unlimited Liquidity to Team Wallet

Criticality	minor
Location	contract.sol#L928

Description

The contract owner has the authority to transfer funds without limit to the team wallet. These funds have been accumulated from fees collected from the contract. The owner may take advantage of it by calling the `withdrawAllToTreasury` method.

```
function withdrawAllToTreasury() external swapping onlyOwner {
    uint256 amountToSwap = _gonBalances[address(this)].div(
        _gonsPerFragment
    );
    require(
        amountToSwap > 0,
        "There is no TED token deposited in token contract"
    );
    address[] memory path = new address[](2);
    path[0] = address(this);
    path[1] = router.WETH();
    router.swapExactTokensForETH(
        amountToSwap,
        0,
        path,
        treasuryReceiver,
        block.timestamp
    );
}
```

Recommendation

The contract could embody a check for the maximum amount of funds that can be swapped. Since a huge amount may volatile the token's price.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

Critical Medium Minor

Severity	Code	Description
	MTS	Manipulate Total Supply
	L01	Public Function could be Declared External
	L04	Conformance to Solidity Naming Conventions
	L05	Unused State Variable
	L07	Missing Events Arithmetic
	L09	Dead Code Elimination
	L13	Divide before Multiply Operation

MTS - Manipulate Total Supply

Criticality	minor
Location	contract.sol#L701

Description

Owner is able to manipulate total supply. This change will have a direct impact on the token price and Market Cap.

```
for (uint256 i = 0; i < times; i++) {
            _totalSupply = _totalSupply
              .mul((10**RATE_DECIMALS).add(rebaseRate))
              .div(10**RATE_DECIMALS);
}
```

Recommendation

The contract owner should carefully manage the adjustment of the circulating supply (increases or decreases), according to the token's price fluctuations.

L01 - Public Function could be Declared External

Criticality	minor
Location	contract.sol#L534,530,526,495,482,628,500,623

Description

Public functions that are never called by the contract should be declared external to save gas.

```
setAddLPAddress
transferOwnership
setAntiBotAmount
owner
renounceOwnership
name
symbol
decimals
```

Recommendation

Use the external attribute for functions never called from the contract.

L04 - Conformance to Solidity Naming Conventions

Criticality	minor
Location	contract.sol#L608,610,623,977,609,1092,583,1071,566,628,1088,607,160,1069,564,550,565,546,237,606,611,1070,1049,158,191,986,1096,579,547,545

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow _ at the beginning of the mixed_case match for private variables and unused parameters.

```
_name
_decimals
feeDenominator
_address
_flag
MINIMUM_LIQUIDITY
DOMAIN_SEPARATOR
_addr
_treasuryReceiver
...
```

Recommendation

Follow the Solidity naming convention.
https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions.

L05 - Unused State Variable

Criticality	minor
Location	contract.sol#L7

Description

There are segments that contain unused state variables.

```
MAX_INT256
```

Recommendation

Remove unused state variables.

L07 - Missing Events Arithmetic

Criticality	minor
Location	contract.sol#L628,787

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
firePitFee = firePitFee_
antiBotDuration = _duration
```

Recommendation

Emit an event for critical parameter changes.

L09 - Dead Code Elimination

Criticality	minor
Location	contract.sol#L35

Description

Functions that are not used in the contract, and make the code's size bigger.

```
abs
```

Recommendation

Remove unused functions.

L13 - Divide before Multiply Operation

Criticality	minor
Location	contract.sol#L682,1078

Description

Performing divisions before multiplications may cause lose of prediction.

```
times = deltaTime.div(720)
liquidityBalance = _gonBalances[pair].div(_gonsPerFragment)
```

Recommendation

The multiplications should be prior to the divisions.

Summary

There are some functions that can be abused by the owner like stopping transactions, manipulating fees and transferring funds to the team’s wallet. The contract can be converted into a honeypot and prevent users from selling if the owner abuses the admin functions. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.
