<b>contract.sol</b>	ee5c8791cf9e29a4955e20890a266bdba300105aebc0d4c16d294af03ff90b5a

## Audit Updates

<b>Initial Audit</b>	28th June 2022
<b>Corrected</b>	

## Contract Analysis

The users have the ability to invest and withdraw tokens from the Nevis Trade Bank. In addition the users have the ability to become referrers to other users. Nevis Trade Bank has one plan which locks your tokens for 365 days and returns 12% interest.

- On every investment on the contract the owner keeps a 10% fee on the contract. If a referrer is set, 1% bonus goes to the referrer's bonus.
- The users can withdraw tokens when the plan time is passed.
- A referrer can withdraw his bonus if he has dividends in the Nevis Trade Bank.

# Contract Diagnostics

● Critical    ● Medium    ● Minor

Severity	Code	Description
●	STC	Succeeded Transfer Check
●	CO	Code Optimization
●	DSM	Data Structure Misuse
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L05	Unused State Variable
●	L09	Dead Code Elimination
●	L13	Divide before Multiply Operation
●	L14	Uninitialized Variables in Local Scope

## STC - Succeeded Transfer Check

**Criticality**

minor

**Location**

contract.sol#L446,L579

### Description

According to the ERC20 specification, the transfer methods should be checked if the result is successful. Otherwise, the contract may wrongly assume that the transfer has been established.

```
token.transferFrom(address(msg.sender),address(this), _amount);
```

```
token.transfer(msg.sender,totalAmount);
```

### Recommendation

The contract should check if the result of the transfer methods is successful.

## CO - Code Optimization

<b>Criticality</b>	minor
<b>Location</b>	contract.sol#L456

### Description

There are code segments that could be optimized. A segment may be optimized so that it becomes a smaller size, consumes less memory, executes more rapidly, or performs fewer operations.

Unnecessary variable check. This code segment can perform fewer operations.

```
if (user.referrer != address(0)) {  
    address upline = user.referrer;  
    if (upline != address(0)) {
```

The function `buy_token` swaps to the same address, so it can be called with the sum of `PROJECT_FEE` and `TOKEN_FEE` to avoid a function call.

```
uint256 fee = _amount.mul(PROJECT_FEE).div(PERCENTS_DIVIDER);  
buy_token(fee);  
uint256 purchase_amount= _amount.mul(TOKEN_FEE).div(PERCENTS_DIVIDER);  
buy_token(purchase_amount);
```

### Recommendation

Rewrite some code segments so the runtime will be more performant.

## DSM - Data Structure Misuse

<b>Criticality</b>	minor
<b>Location</b>	contract.sol#L384

### Description

The contract uses the valuable `_confirmedSnipers` as an array. The business logic of the contract does not require to iterate this structure sequentially. Thus, unnecessary loops are produced that increase the required gas. Since the contract plan is always one, it could be a variable rather than an array.

```
Plan[] internal plans;
```

### Recommendation

The contract could use a data structure that provides instant access. For instance, a Set or a Map would fit better to the business logic of the contract. This way the time complexity will be reduced from  $O(n)$  to  $O(1)$ .

## L01 - Public Function could be Declared External

**Criticality**

minor

**Location**

contract.sol#L67,556,645,641,42,78,38,53,73,34,637,46,62,58

### Description

Public functions that are never called by the contract should be declared external to save gas.

```
allowance
approve
totalSupply
getContractBUSDBalance
name
increaseAllowance
transfer
symbol
decreaseAllowance
...
```

### Recommendation

Use the external attribute for functions never called from the contract.

## L02 - State Variables could be Declared Constant

**Criticality**

minor

**Location**

contract.sol#L31,359,367,30,28,32,371,20,368,372,370

### Description

Constant state variables should be declared constant to save gas.

```
NEVIS_TOKEN
Pair
totalRefBonus
busd
BUSD
_decimals
_limitSupply
_name
totalInvested
...
```

### Recommendation

Add the constant attribute to state variables that never change.

## L04 - Conformance to Solidity Naming Conventions

**Criticality**

minor

**Location**

contract.sol#L425,372,28,31,181,197,370,359,440,180,22,30,495,356,218,371,594,32

### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

```
_decimals  
_Amount  
BUSD  
WETH  
NevisSwapRouter  
buy_token  
_name  
nevis_token  
DOMAIN_SEPARATOR  
...
```

### Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

## L05 - Unused State Variable

**Criticality**

minor

**Location**

contract.sol#L28,410

### Description

There are segments that contain unused state variables.

```
referralAddress  
_limitSupply
```

### Recommendation

Remove unused state variables.

## L09 - Dead Code Elimination

**Criticality**

minor

**Location**

contract.sol#L94

### Description

Functions that are not used in the contract, and make the code's size bigger.

```
_burn
```

### Recommendation

Remove unused functions.

## L13 - Divide before Multiply Operation

**Criticality**

minor

**Location**

contract.sol#L613

### Description

Performing divisions before multiplications may cause lose of prediction.

```
share = user.deposits[i].amount.mul(plans[user.deposits[i].plan].percent).div(PANPER_DIVIDER)
```

### Recommendation

The multiplications should be prior to the divisions.

## L14 - Uninitialized Variables in Local Scope

**Criticality**

minor

**Location**

contract.sol#L616

### Description

There are variables that are defined in the local scope and are not initialized.

```
totalAmount
```

### Recommendation

All the local scoped variables should be initialized.

## Summary

Nevis Investment Token is an interesting project that has a friendly and growing community. The Smart Contract analysis reported no compiler error or critical issues. The contract Owner can access some admin functions that can not be used in a malicious way to disturb the users' transactions.

## About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.
