## Audit Updates

<b>Initial Audit</b>	9th July 2022
<b>Corrected</b>	

## Contract Analysis

- The users have the ability to buy oil wells by paying in the native currency.
- The price of the oil wells depends on some variations like the quantity eths that are invested in the contract, the current market well and the Oil Club contract's native currency balance.
- The buy and sell amount is taxed by 2% dev, the taxed amount is moved directly to the owner of the contract.
- The users produce oil from the wells (miners) in order to redeem the generated oil from the last hatch.
- The redeem process is called "hatch".
- During the hatch process the referred user takes 50% of the user's generated oil as a reward.

## Contract Owner Privileges

The contract owner does not disturb the user's experience in any means.

# Contract Diagnostics

● Critical    ● Medium    ● Minor

Severity	Code	Description
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L05	Unused State Variable
●	L13	Divide before Multiply Operation

## Contract Balance Dependency

**Criticality**

minor

**Location**

contract.sol

### Description

The calculation of the sell and buy price heavily depends on the oilClub contract's amount. That means that the same amount of oil well can be bought and sold at quite different prices according to the contract's balance. This calculation may be abused by the users and produce unexpected results in the financial ecosystem.

Below is the calculated oil quantity as a result of the amount, contract balance and oil supply:

Amount	Contract Balance	Supply	Result
1	1000000	1080000000000	107999.892000108
10	1000000	1080000000000	1079989.200107999
100	1000000	1080000000000	10798920.107989201

The following is the same amounts with different contract balance:

Amount	Contract Balance	Supply	Result
1	1000	1080000000000	107892107.89210789
10	1000	1080000000000	1069306930.6930693
100	1000	1080000000000	9818181818.181818

### Recommendation

The contract could exclude the contract's balance from the price calculations or use a weight in the calculations so it cannot heavily affect the prices.

## L01 - Public Function could be Declared External

<b>Criticality</b>	minor
<b>Location</b>	contract.sol#L45,55,60,141,155,161,192,200,206,210,214,218,222,230,234

### Description

Public functions that are never called by the contract should be declared external to save gas.

```
getSecondsPassed  
getBlockTime  
getLastHatch  
getLastSell  
getMyStreak  
getMyMiners  
getBalance  
seedMarket  
calculateWellsBuySimple  
...
```

### Recommendation

Use the external attribute for functions never called from the contract.

## L02 - State Variables could be Declared Constant

**Criticality**

minor

**Location**

contract.sol#L74,75,76,77,79,80,78

### Description

Constant state variables should be declared constant to save gas.

```
strikeDailyPump  
maxStrikeBonus  
holdWeekBonus  
devFeeVal  
OIL_COEFH  
OIL_COEF  
LEASE_COEF
```

### Recommendation

Add the constant attribute to state variables that never change.

## L04 - Conformance to Solidity Naming Conventions

<b>Criticality</b>	minor
<b>Location</b>	contract.sol#L71,97,74,75,76

### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

```
OIL_COEFH  
OIL_COEF  
LEASE_COEF  
seconds_hold  
oilClub
```

### Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>.

## L05 - Unused State Variable

**Criticality**

minor

**Location**

contract.sol#L78

### Description

There are segments that contain unused state variables.

```
strikeDailyPump
```

### Recommendation

Remove unused state variables.

## L13 - Divide before Multiply Operation

**Criticality**

minor

**Location**

contract.sol#L97,104

### Description

Performing divisions before multiplications may cause lose of prediction.

```
bonusMiners = SafeMath.mul(SafeMath.div(newMiners,100),strike_bonus)
weekz = SafeMath.div(dayz,7)
```

### Recommendation

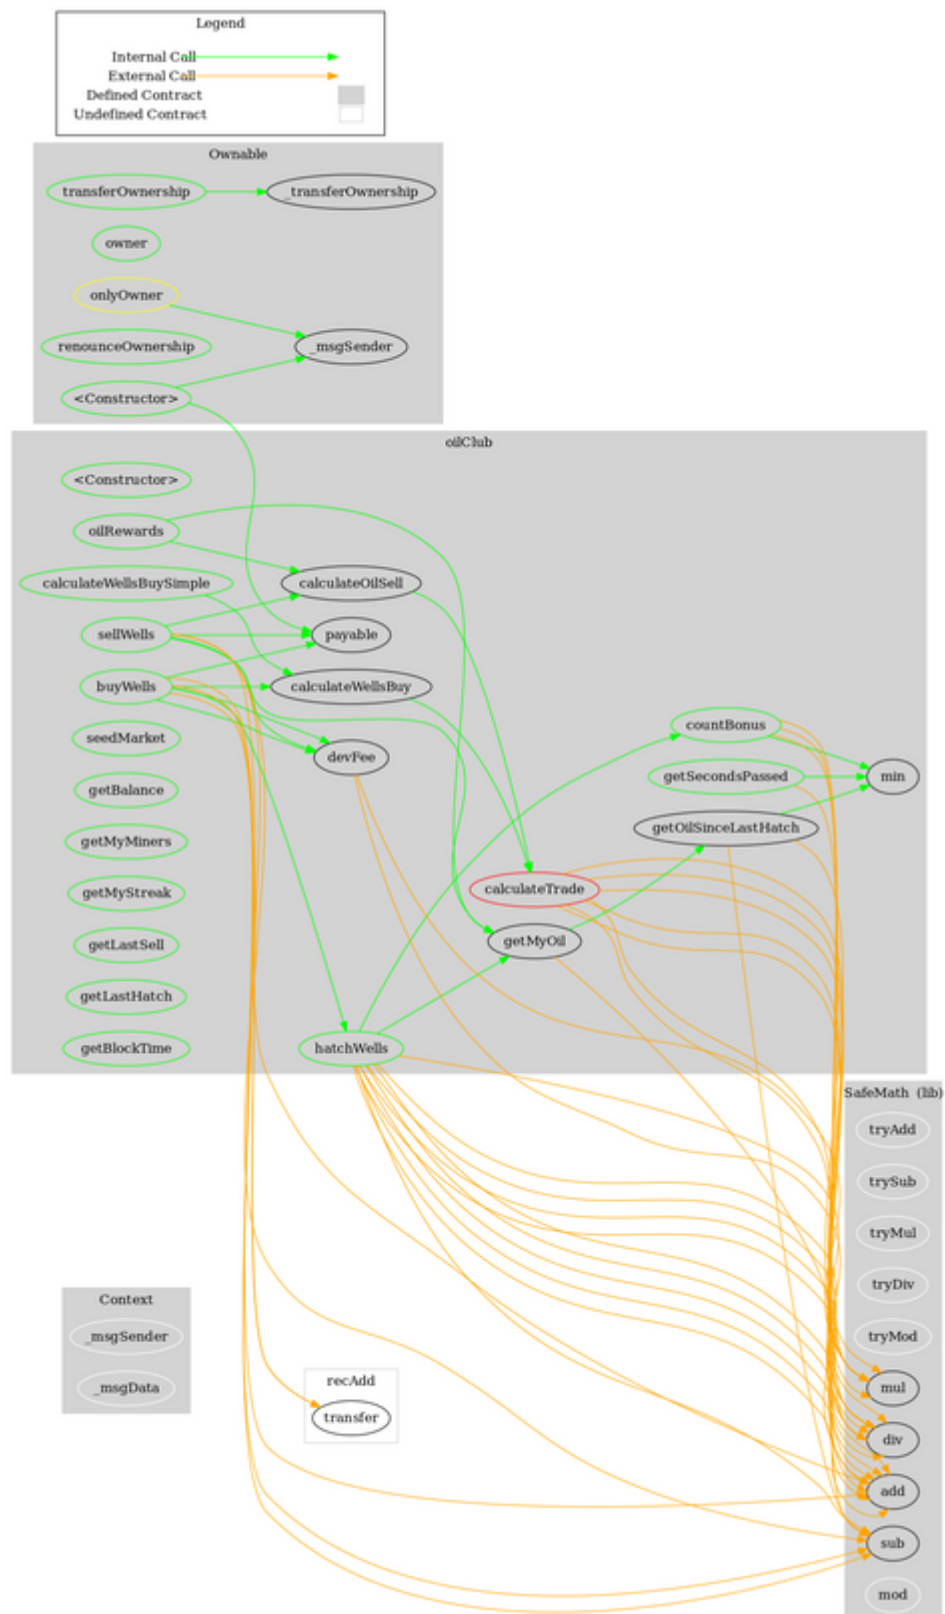

The multiplications should be prior to the divisions.

# Contract Functions

## Summary

Oil Club is a novel project where users have the ability to oil wells in order to redeem oil. The users can later claim the awarded amount that is based on the time period that has elapsed, the quantity of oil and the contract's balance. This audit focuses on the business logic, the security concerns and performance improvements.

## About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Cyberscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.
