ST - Stops Transactions

Criticality	Medium
Location	BullsRunToken.sol#L490,495,500
Status	Unresolved

Description

The contract owner has the authority to stop the sales for all users excluding the owner. The owner may take advantage of it by setting the `_maxTxAmount` to zero.

```
if (!authorizations[sender] && recipient != address(this) && recipient !=  
address(DEAD) && recipient != pair && recipient != marketingFeeReceiver && recipient  
!= devFeeReceiver && recipient != autoLiquidityReceiver){  
    uint256 heldTokens = balanceOf(recipient);  
    require((heldTokens + amount) <= _maxWalletToken, "Total Holding is currently  
limited, you can not buy that much.");  
    ...  
    require(cooldownTimer[recipient] < block.timestamp, "Please wait for 1min between two  
buys");  
    ...  
    checkTxLimit(sender, amount);
```

Recommendation

The contract could embody a check for not allowing setting the `_maxTxAmount` less than a reasonable amount. A suggested implementation could check that the maximum amount should be more than a fixed percentage of the total supply. The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. Some suggestions are:

- Introduce a time-locker mechanism with a reasonable delay.
- Introduce a multi-sign wallet so that many addresses will confirm the action.
- Introduce a governance model where users will vote about the actions.
- Renouncing the ownership will eliminate the threats but it is non-reversible.

Team Update

The owner followed our suggestion and renounced ownership at the following transaction:

<https://bscscan.com/tx/0x8b227e9d3677b6de20cf80367d10d151bc44b1ae3fdd30b700a138f2d9ed6b4b> This audit finding remains unresolved, since the

`setTxLimit` function is accessible from authorized users, including the owner.

OTUT - Transfers User's Tokens

Criticality	Minor / Informative
Location	BullsRunToken.sol#L716,743
Status	Renounced

Description

The contract owner has the authority to transfer the balance of a user's address to any address or addresses without allowance. The owner may take advantage of it by calling the `multiTransfer` or `multiTransfer_fixed` functions.

```
function multiTransfer(address from, address[] calldata addresses, uint256[]  
calldata tokens) external onlyOwner { ... }  
  
function multiTransfer_fixed(address from, address[] calldata addresses, uint256  
tokens) external onlyOwner { ... }
```

Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. Some suggestions are:

- Introduce a time-locker mechanism with a reasonable delay.
- Introduce a multi-sign wallet so that many addresses will confirm the action.
- Introduce a governance model where users will vote about the actions.
- Renouncing the ownership will eliminate the threats but it is non-reversible.

Team Update

The owner followed our suggestion and renounced ownership at the following transaction:

<https://bscscan.com/tx/0x8b227e9d3677b6de20cf80367d10d151bc44b1ae3fdd30b700a138f2d9ed6b4b>

ELFM - Exceeds Fees Limit

Criticality	Medium
Location	BullsRunToken.sol#L666
Status	Unresolved

Description

The contract owner has the authority to increase over the allowed limit of 25%. The owner may take advantage of it by calling the `setFees` function with a high percentage value.

```
function setFees(uint256 _liquidityFee, uint256 _reflectionFee, uint256
_marketingFee, uint256 _feeDenominator) external authorized {
    liquidityFee = _liquidityFee;
    reflectionFee = _reflectionFee;
    marketingFee = _marketingFee;
    devFee = 1;
    totalFee = _liquidityFee.add(_reflectionFee).add(_marketingFee).add(devFee);
    feeDenominator = _feeDenominator;
    require(totalFee < feeDenominator/3, "Fees cannot be more than 33%");
}
```

Recommendation

The contract could embody a check for the maximum acceptable value. The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. Some suggestions are:

- Introduce a time-locker mechanism with a reasonable delay.
- Introduce a multi-sign wallet so that many addresses will confirm the action.
- Introduce a governance model where users will vote about the actions.
- Renouncing the ownership will eliminate the threats but it is non-reversible.

Team Update

The owner followed our suggestion and renounced ownership at the following transaction:

<https://bscscan.com/tx/0x8b227e9d3677b6de20cf80367d10d151bc44b1ae3fdd30b700a138f2d9ed6b4b>

This audit finding remains unresolved, since the `setFees` function is accessible from authorized users, including the owner.

BC - Blacklists Addresses

Criticality	Critical
Location	BullsRunToken.sol#L647
Status	Renounced

Description

The contract owner has the authority to massively stop addresses from transactions. The owner may take advantage of it by calling the `manage_blacklist` function.

```
function manage_blacklist(address[] calldata addresses, bool status) public
onlyOwner {
    for (uint256 i; i < addresses.length; ++i) {
        isBlacklisted[addresses[i]] = status;
    }
}
```

Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. Some suggestions are:

- Introduce a time-locker mechanism with a reasonable delay.
- Introduce a multi-sign wallet so that many addresses will confirm the action.
- Introduce a governance model where users will vote about the actions.
- Renouncing the ownership will eliminate the threats but it is non-reversible.

Team Update

The owner followed our suggestion and renounced ownership at the following transaction:

<https://bscscan.com/tx/0x8b227e9d3677b6de20cf80367d10d151bc44b1ae3fdd30b700a138f2d9ed6b4b>

Diagnostics

● Critical ● Medium ● Minor / Informative

Severity	Code	Description	Status
●	DDP	Decimal Division Precision	Unresolved
●	PVC	Price Volatility Concern	Unresolved
●	IDI	Immutable Declaration Improvement	Unresolved
●	L02	State Variables could be Declared Constant	Unresolved
●	L04	Conformance to Solidity Naming Conventions	Unresolved
●	L07	Missing Events Arithmetic	Unresolved
●	L14	Uninitialized Variables in Local Scope	Unresolved
●	L16	Validate Variable Setters	Unresolved
●	L20	Succeeded Transfer Check	Unresolved

DDP - Decimal Division Precision

Criticality	Minor / Informative
Location	BullsRunToken.sol#L607
Status	Unresolved

Description

Division of decimal (fixed point) numbers can result in rounding errors due to the way that division is implemented in Solidity. Thus, it may produce issues with precise calculations with decimal numbers.

Solidity represents decimal numbers as integers, with the decimal point implied by the number of decimal places specified in the type (e.g. decimal with 18 decimal places). When a division is performed with decimal numbers, the result is also represented as an integer, with the decimal point implied by the number of decimal places in the type. This can lead to rounding errors, as the result may not be able to be accurately represented as an integer with the specified number of decimal places.

Hence, the splitted shares will not have the exact precision and some funds may not be calculated as expected.

```
uint256 amountBNBLiquidity =  
amountBNB.mul(dynamicLiquidityFee).div(totalBNBFee).div(2);  
uint256 amountBNBReflection = amountBNB.mul(reflectionFee).div(totalBNBFee);  
uint256 amountBNBMarketing = amountBNB.mul(marketingFee).div(totalBNBFee);  
uint256 amountBNBDev = amountBNB.mul(devFee).div(totalBNBFee);
```

Recommendation

The contract could calculate the subtraction of the divided funds in the last calculation in order to avoid the division rounding issue.

PVC - Price Volatility Concern

Criticality	Minor / Informative
Location	BullsRunToken.sol#L682
Status	Unresolved

Description

The contract accumulates tokens from the taxes to swap them for ETH. The variable `swapThreshold` sets a threshold where the contract will trigger the swap functionality. If the variable is set to a big number, then the contract will swap a huge amount of tokens for ETH.

It is important to note that the price of the token representing it, can be highly volatile. This means that the value of a price volatility swap involving Ether could fluctuate significantly at the triggered point, potentially leading to significant price volatility for the parties involved.

```
function setSwapBackSettings(bool _enabled, uint256 _amount) external authorized {  
    swapEnabled = _enabled;  
    swapThreshold = _amount;  
}
```

Recommendation

The contract could ensure that it will not sell more than a reasonable amount of tokens in a single transaction. A suggested implementation could check that the maximum amount should be less than a fixed percentage of the total supply. Hence, the contract will guarantee that it cannot accumulate a huge amount of tokens in order to sell them.

IDI - Immutable Declaration Improvement

Criticality	Minor / Informative
Location	BullsRunToken.sol#L401,402,405
Status	Unresolved

Description

The contract is using variables that initialize them only in the constructor. The other functions are not mutating the variables. These variables are not defined as `immutable`.

```
route
pai
distributo
```

Recommendation

By declaring a variable as `immutable`, the Solidity compiler is able to make certain optimizations. This can reduce the amount of storage and computation required by the contract, and make it more gas-efficient.

L02 - State Variables could be Declared Constant

Criticality	Minor / Informative
Location	BullsRunToken.sol#L184,197,341,342,343,344,350
Status	Unresolved

Description

State variables can be declared as constant using the constant keyword. This means that the value of the state variable cannot be changed after it has been set. Additionally, the constant variables decrease gas consumption of the corresponding transaction.

```
address WBNB = 0xbb4CdB9CBd36B01bD1cBaEaF2De08d9173bc095c
uint256 public dividendsPerShareAccuracyFactor = 10 ** 36
address DEAD = 0x00000000000000000000000000000000dEaD
address ZERO = 0x0000000000000000000000000000000000000000
address DEV = 0x986aB885cC22Bb4Fc16d0C77FC53039b0B7F6f7f
uint256 totalSupply = 200000 * 10**6 * 10** decimals
```

Recommendation

Constant state variables can be useful when the contract wants to ensure that the value of a state variable cannot be changed by any function in the contract. This can be useful for storing values that are important to the contract's behavior, such as the contract's address or the maximum number of times a certain function can be called. The team is advised to add the `constant` keyword to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality	Minor / Informative
Location	BullsRunToken.sol#L119,175,183,184,222,341,342,343,344,346,347,348,350,352,353,355,356,463,466,564,569,574,579,643,647,666,676,682,687,692,743
Status	Unresolved

Description

The Solidity style guide is a set of guidelines for writing clean and consistent Solidity code. Adhering to a style guide can help improve the readability and maintainability of the Solidity code, making it easier for others to understand and work with.

The followings are a few key points from the Solidity style guide:

1. Use camelCase for function and variable names, with the first letter in lowercase (e.g., myVariable, updateCounter).
2. Use PascalCase for contract, struct, and enum names, with the first letter in uppercase (e.g., MyContract, UserStruct, ErrorEnum).
3. Use uppercase for constant variables and enums (e.g., MAX_VALUE, ERROR_CODE).
4. Use indentation to improve readability and structure.
5. Use spaces between operators and after commas.
6. Use comments to explain the purpose and behavior of the code.
7. Keep lines short (around 120 characters) to improve readability.

```
function WETH() external pure returns (address);  
address _token  
IBEP20 RWRD = IBEP20(0x2170Ed0880ac9A755fd29B2688956BD959F933F8)  
address WBNB = 0xbb4CdB9CBd36B01bd1cBaEbf2De08d9173bc095c  
uint256 _minDistribution  
uint256 _minPeriod  
address DEAD = 0x0000000000000000000000000000000000000000000000000000000000000000dead  
address ZERO = 0x0000000000000000000000000000000000000000000000000000000000000000  
address DEV = 0x986aB885cC22Bb4Fc16d0C77FC53039b0B7f6f7f  
string constant _name = "Bulls Run Token"  
string constant _symbol = "BULLS RUN"  
uint8 constant _decimals = 9  
uint256 _totalSupply = 200000 * 10**6 * 10**_decimals  
uint256 public _maxTxAmount = _totalSupply  
  
...  

```

Recommendation

By following the Solidity naming convention guidelines, the codebase increased the readability, maintainability, and makes it easier to work with.

Find more information on the Solidity documentation

[https://docs.soliditylang.org/en/v0.8.17/style-guide.html#naming-convention.](https://docs.soliditylang.org/en/v0.8.17/style-guide.html#naming-convention)

L07 - Missing Events Arithmetic

Criticality	Minor / Informative
Location	BullsRunToken.sol#L223,467,471,570,667,684,688
Status	Unresolved

Description

Events are a way to record and log information about changes or actions that occur within a contract. They are often used to notify external parties or clients about events that have occurred within the contract, such as the transfer of tokens or the completion of a task.

It's important to carefully design and implement the events in a contract, and to ensure that all required events are included. It's also a good idea to test the contract to ensure that all events are being properly triggered and logged.

```
minPeriod = _minPeriod
_maxTxAmount = ( _totalSupply * maxTXPercentage_base1000 ) / 1000
_maxTxAmount = amount
sellMultiplier = Multiplier
liquidityFee = _liquidityFee
swapThreshold = _amount
targetLiquidity = _target
```

Recommendation

By including all required events in the contract and thoroughly testing the contract's functionality, the contract ensures that it performs as intended and does not have any missing events that could cause issues with its arithmetic.

L14 - Uninitialized Variables in Local Scope

Criticality	Minor / Informative
Location	BullsRunToken.sol#L648
Status	Unresolved

Description

Using an uninitialized local variable can lead to unpredictable behavior and potentially cause errors in the contract. It's important to always initialize local variables with appropriate values before using them.

```
uint256 i
```

Recommendation

By initializing local variables before using them, the contract ensures that the functions behave as expected and avoid potential issues.

L16 - Validate Variable Setters

Criticality	Minor / Informative
Location	BullsRunToken.sol#L105,677,678
Status	Unresolved

Description

The contract performs operations on variables that have been configured on user-supplied input. These variables are missing of proper check for the case where a value is zero. This can lead to problems when the contract is executed, as certain actions may not be properly handled when the value is zero.

```
owner = adr
autoLiquidityReceiver = _autoLiquidityReceiver
marketingFeeReceiver = _marketingFeeReceiver
```

Recommendation

By adding the proper check, the contract will not allow the variables to be configured with zero value. This will ensure that the contract can handle all possible input values and avoid unexpected behavior or errors. Hence, it can help to prevent the contract from being exploited or operating unexpectedly.

L20 - Succeeded Transfer Check

Criticality	Minor / Informative
Location	BullsRunToken.sol#L300
Status	Unresolved

Description

According to the ERC20 specification, the transfer methods should be checked if the result is successful. Otherwise, the contract may wrongly assume that the transfer has been established.

```
RWRD.transfer(shareholder, amount)
```

Recommendation

The contract should check if the result of the transfer methods is successful. The team is advised to check the SafeERC20 library from the [Openzeppelin library](#).

Inheritance Graph

Flow Graph

Summary

Bulls Run Token contract implements a token mechanism. This audit investigates security issues, business logic concerns, and potential improvements.

The owner has renounced ownership at the following transaction:
<https://bscscan.com/tx/0x8b227e9d3677b6de20cf80367d10d151bc44b1ae3fdd30b700a138f2d9ed6b4b>.

There are some functions that can still be abused by authorized users, including the owner, like stopping transactions and manipulating the fees. The contract can prevent users from selling if authorized users abuse the admin functions.

This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes nor may copies be delivered to any other person other than the Company without Cyberscope's prior written consent. This report is not nor should be considered an "endorsement" or "disapproval" of any particular project or team. This report is not nor should be regarded as an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Cyberscope to perform a security assessment. This document does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors' business, business model or legal compliance. This report should not be used in any way to make decisions around investment or involvement with any particular project. This report represents an extensive assessment process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk. Cyberscope's position is that each company and individual are responsible for their own due diligence and continuous security. Cyberscope's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies and in no way claims any guarantee of security or functionality of the technology we agree to analyze. The assessment services provided by Cyberscope are subject to dependencies and are under continuing development. You agree that your access and/or use including but not limited to any services reports and materials will be at your sole risk on an as-is where-is and as-available basis. Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives, false negatives and other unpredictable results. The services may access and depend upon multiple layers of third parties.

About Cyberscope

Cyberscope is a blockchain cybersecurity company that was founded with the vision to make web3.0 a safer place for investors and developers. Since its launch, it has worked with thousands of projects and is estimated to have secured tens of millions of investors' funds.

Cyberscope is one of the leading smart contract audit firms in the crypto space and has built a high-profile network of clients and partners.

The Cyberscope team
