# Contract Analysis

● Critical ● Medium ● Minor / Informative ● Pass

Severity	Code	Description	Status
●	ST	Stops Transactions	Passed
●	OCTD	Transfers Contract's Tokens	Passed
●	OTUT	Transfers User's Tokens	Passed
●	ELFM	Exceeds Fees Limit	Passed
●	ULTW	Transfers Liquidity to Team Wallet	Unresolved
●	MT	Mints Tokens	Passed
●	BT	Burns Tokens	Passed
●	BC	Blacklists Addresses	Passed

## ULTW - Transfers Liquidity to Team Wallet

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L759
<b>Status</b>	Unresolved

### Description

The contract owner has the authority to transfer funds without limit to the team wallet. These funds have been accumulated from fees collected from the contract. The owner may take advantage of it by calling the `rescueBNB` method.

```
function rescueBNB(uint256 weiAmount) external onlyOwner {  
    payable(owner()).transfer(weiAmount);  
}
```

### Recommendation

The contract could embody a check for the maximum amount of funds that can be swapped. Since a huge amount may volatile the token's price.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

# Contract Diagnostics

● Critical   ● Medium   ● Minor / Informative

Severity	Code	Description	Status
●	STC	Succeeded Transfer Check	Unresolved
●	FSA	Fixed Swap Address	Unresolved
●	CO	Code Optimization	Unresolved
●	L01	Public Function could be Declared External	Unresolved
●	L02	State Variables could be Declared Constant	Unresolved
●	L03	Redundant Statements	Unresolved
●	L04	Conformance to Solidity Naming Conventions	Unresolved
●	L07	Missing Events Arithmetic	Unresolved
●	L13	Divide before Multiply Operation	Unresolved
●	L14	Uninitialized Variables in Local Scope	Unresolved

## STC - Succeeded Transfer Check

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L763
<b>Status</b>	Unresolved

### Description

According to the ERC20 specification, the transfer methods should be checked if the result is successful. Otherwise, the contract may wrongly assume that the transfer has been established.

```
function rescueBSC20(address tokenAdd, uint256 amount) external onlyOwner {  
    require(tokenAdd != address(this), "Owner can't claim contract's balance of its own  
tokens");  
    IBEP20(tokenAdd).transfer(owner(), amount);  
}
```

### Recommendation

The contract should check if the result of the transfer methods is successful.

## FSA - Fixed Swap Address

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L445
<b>Status</b>	Unresolved

### Description

The swap address is assigned once in the constructor and it can not be changed. The decentralized swaps sometimes create a new swap version or abandon the current. A contract that cannot change the swap address may not be able to catch-up the upgrade.

```
constructor() BEP20("HUBIN NETWORK", "HBN") {  
    _tokengeneration(msg.sender, 1e8 * 10**decimals());  
    exemptFee[msg.sender] = true;  
  
    IRouter _router = IRouter(0x10ED43C718714eb63d5aA57B78B54704E256024E);  
    // Create a pancake pair for this new token  
    address _pair = IFactory(_router.factory()).createPair(address(this), _router.WETH());
```

### Recommendation

It could be better to allow the swap address mutation in case of future swap updates.

## CO - Code Optimization

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L554
<b>Status</b>	Unresolved

### Description

1. The contract is repeating a predefined calculation in every transaction.
2. The contract is repeating the same value in two variables.

```
else if (recipient == pair && !useLaunchFee) {
    feeswap =
        sellTaxes.liquidity +
        sellTaxes.marketing +
        sellTaxes.ops +
        sellTaxes.dev;
    feesum = feeswap;
    currentTaxes = sellTaxes;
} else if (!useLaunchFee) {
    feeswap =
        taxes.liquidity +
        taxes.marketing +
        taxes.ops +
        taxes.dev ;
    feesum = feeswap;
    currentTaxes = taxes;
} else if (useLaunchFee) {
    feeswap = launchtax;
    feesum = launchtax;
}
```

### Recommendation

1. The sell and the buy taxes sum could be calculated once in the setter segments of sellTaxes and taxes.
2. Since the `feesum` is always the `feeswap` value, it is redundant to use both variables.

## L01 - Public Function could be Declared External

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L90,207,336,230,181,82,340,133,146,163,114
<b>Status</b>	Unresolved

### Description

Public functions that are never called by the contract should be declared external to save gas.

```
symbol
increaseAllowance
renounceOwnership
decreaseAllowance
transferFrom
name
transferOwnership
transfer
allowance
...
```

### Recommendation

Use the external attribute for functions never called from the contract.

## L02 - State Variables could be Declared Constant

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L403
<b>Status</b>	Unresolved

### Description

Constant state variables should be declared constant to save gas.

```
launchtax
```

### Recommendation

Add the constant attribute to state variables that never change.

## L03 - Redundant Statements

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L5
<b>Status</b>	Unresolved

### Description

The contract contains statements that are not used and have no effect. As a result, those segments increase the code size of the contract unnecessarily.

Context

### Recommendation

Remove the redundant statements in order to decrease the code size.

## L04 - Conformance to Solidity Naming Conventions

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L683,693,692,686,694,682,709,401,408,702,359,696,56,685,589,684,58,695,736,676
<b>Status</b>	Unresolved

### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow `_` at the beginning of the mixed\_case match for private variables and unused parameters.

```
_marketing  
SetSellTaxes  
_dev  
_liquidity  
SetBuyTaxes  
_deadline  
genesis_block  
deadWallet  
EnableTrading  
...
```

### Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>.

## L07 - Missing Events Arithmetic

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L746,676,730,709
<b>Status</b>	Unresolved

### Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
maxBuyLimit = maxBuy * 10 ** decimals()
tokenLiquidityThreshold = new_amount * 10 ** decimals()
coolDownTime = time * 1
deadline = _deadline
```

### Recommendation

Emit an event for critical parameter changes.

## L13 - Divide before Multiply Operation

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L589
<b>Status</b>	Unresolved

### Description

Performing divisions before multiplications may cause lose of prediction.

```
unitBalance = deltaBalance / (denominator - swapTaxes.liquidity)
```

### Recommendation

The multiplications should be prior to the divisions.

## L14 - Uninitialized Variables in Local Scope

<b>Criticality</b>	minor / informative
<b>Location</b>	contract.sol#L537,539,536
<b>Status</b>	Unresolved

### Description

There are variables that are defined in the local scope and are not initialized.

```
feesum  
currentTaxes  
feeswap
```

### Recommendation

All the local scoped variables should be initialized.

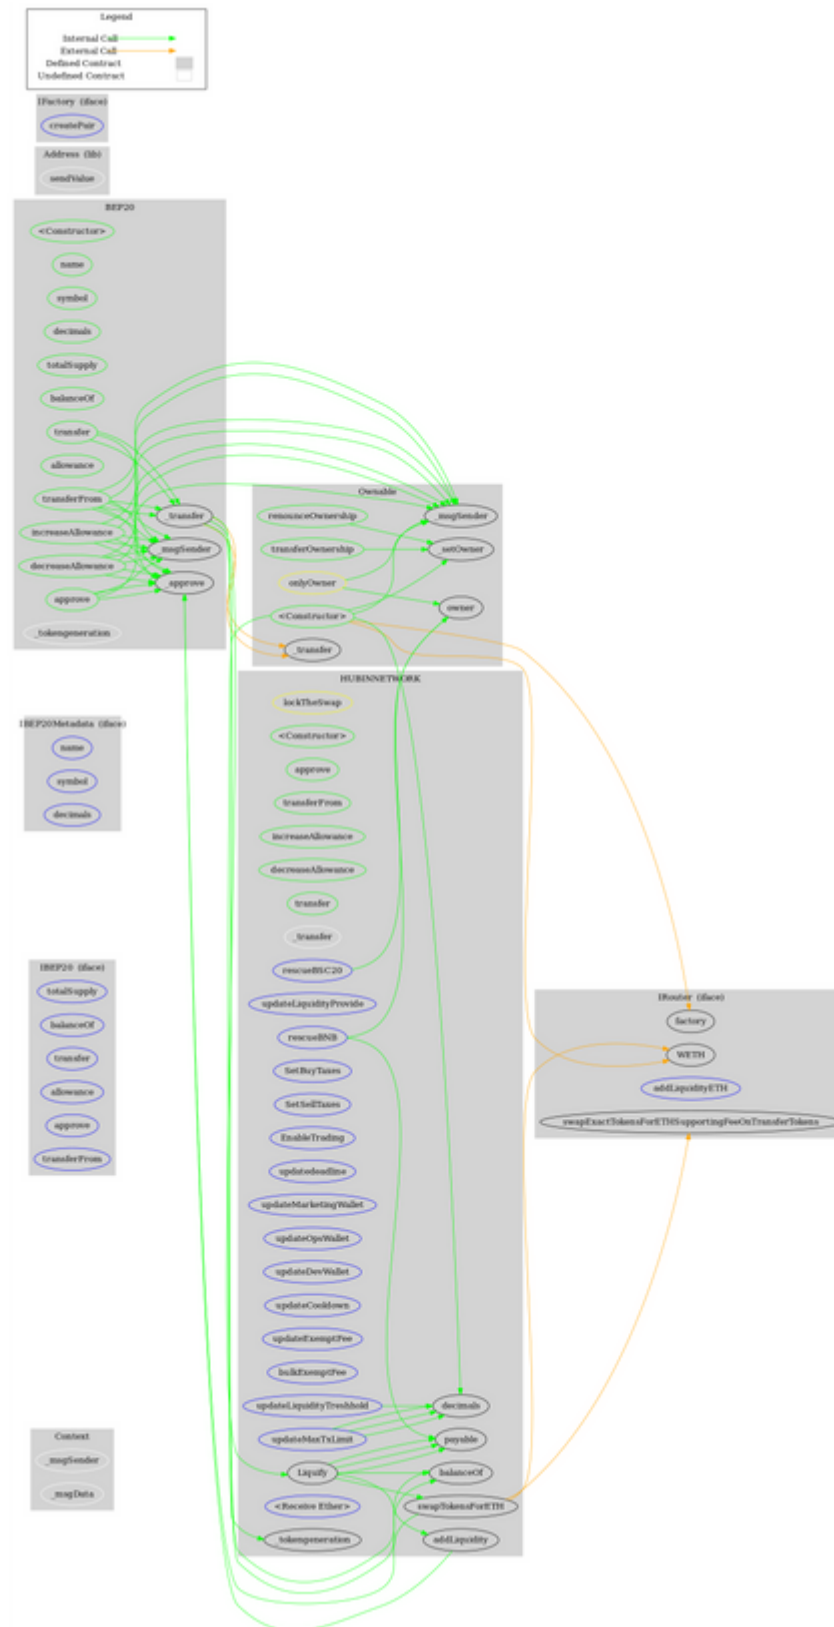

# Contract Functions

# Contract Flow

## Summary

The Smart Contract analysis reported one minor severity issue. The contract owner has the authority to transfer funds to the team's wallet.

The contract will increase the transaction fees to 99 for a max of 5 blocks. There is also a limit of max 14% on sell fees and 10% buy fees.

Other than that, the contract owner can access some admin functions that can not be used in a malicious way to disturb the users' transactions.

## About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Cyberscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.
