Audit Updates

Initial Audit	18th June 2022
Corrected	27th June 2022

Contract Analysis

● Critical ● Medium ● Minor ● Pass

Severity	Code	Description
●	ST	Contract Owner is not able to stop or pause transactions
●	OCTD	Contract Owner is not able to transfer tokens from specific address
●	OTUT	Owner Transfer User's Tokens
●	ELFM	Contract Owner is not able to increase fees more than a reasonable percent (25%)
●	ULTW	Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent
●	MT	Contract Owner is not able to mint new tokens
●	BT	Contract Owner is not able to burn tokens from specific wallet
●	BC	Contract Owner is not able to blacklist wallets from selling

ST - Stop Transactions

Criticality	critical
Location	contract.sol#L804, 769

Description

Users are not able to sell more than 5% of their holdings every day.

```
checkLimit(sender, recipient, amount);
```

```
function checkLimit(address sender,
    address recipient,
    uint256 amount) internal {
    if (recipient == pair && !_isFeeExempt[sender]) {
        uint256 limitSell =
            balanceOf(sender).mul(maxSellPerDay).div(10000);
        require(amount <= limitSell, "Alpha Protocol: Cant Sell More Than
            Allowed Per Day");
        if (block.timestamp > lastSell[sender].timestamp +
            TwentyFourHours) {
            lastSell[sender].timestamp = block.timestamp;
            lastSell[sender].amount = amount;
        } else if ((block.timestamp < lastSell[sender].timestamp +
            TwentyFourHours) && (block.timestamp > lastSell[sender].timestamp)) {
            require(lastSell[sender].amount + amount <= limitSell, "Alpha
            Protocol: Cant Sell More Than Allowed Per Day");
            lastSell[sender].amount = lastSell[sender].amount + amount;
        }
    }
}
```

Recommendation

The team should embody a method which allows the users to sell more than a reasonable amount of tokens in a short timespan.

OCTD - Owner Contract Tokens Drain

Criticality	minor
Location	contract.sol#L974

Description

The contract owner has the authority to claim all the balance of the contract. The owner may take advantage of it by calling the `withdrawAllToTreasury` function.

```
function withdrawAllToTreasury() external swapping onlyOwner {  
    uint256 amountToSwap =  
        _gonBalances[address(this)].div(_gonsPerFragment);  
    require( amountToSwap > 0,"There is no AlphaPro token deposited in  
token contract");  
    address[] memory path = new address[](2);  
    path[0] = address(this);  
    path[1] = router.WETH();  
    router.swapExactTokensForETHSupportingFeeOnTransferTokens(  
        amountToSwap,  
        0,  
        path,  
        treasuryReceiver,  
        block.timestamp  
    );  
}
```

Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

ELFM - Exceed Limit Fees Manipulation

Criticality	critical
Location	contract.sol#L1143

Description

The contract owner has the authority to increase over the allowed limit of 25%. The owner may take advantage of it by calling the `setTransferTax` function with 5000. As a result, the fees will be 50%.

```
function setTransferTax(uint256 newTransferTax) external onlyOwner {
    require(newTransferTax <= 5000, "AlphaPro: Maximum Transfer Tax Is 50%");
    require(newTransferTax >= 0, "AlphaPro: Minimum Transfer Tax Is 0%");
    transferTax = newTransferTax;
}
```

Recommendation

The contract could embody a check for the maximum acceptable value of 25%.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

Contract Diagnostics

● Critical ● Medium ● Minor

Severity	Code	Description
●	FSA	Fixed Swap Address
●	MAL	Misused Algorithmic Logic
●	MTS	Manipulate Total Supply
●	L01	Public Function could be Declared External
●	L02	State Variables could be Declared Constant
●	L04	Conformance to Solidity Naming Conventions
●	L05	Unused State Variable
●	L07	Missing Events Arithmetic
●	L08	Tautology or Contradiction
●	L09	Dead Code Elimination
●	L13	Divide before Multiply Operation
●	L14	Uninitialized Variables in Local Scope

FSA - Fixed Swap Address

Criticality	minor
Location	contract.sol#L668

Description

The swap address is assigned once in the constructor and it can not be changed. The decentralized swaps sometimes create a new swap version or abandon the current. A contract that cannot change the swap address may not be able to catch-up the upgrade.

```
router = IPancakeSwapRouter(0x10ED43C718714eb63d5aA57B78B54704E256024E);
```

Recommendation

It could be better to allow the swap address mutation in case of future swap updates.

MAL - Misused Algorithmic Logic

Criticality	minor
Location	contract.sol#L711

Description

The algorithmic flow does not follow the required business logic. In the following statement the third and the forth if will never be fulfilled since an unsigned integer is either less than or greater/equal to 365 days. Hence, always the first two if statements will be fulfilled.

```
if (deltaTimeFromInit <= (365 days)) {  
    rebaseRate = 39435595;  
} else if (deltaTimeFromInit >= (365 days)) {  
    rebaseRate = 19717797;  
} else if (deltaTimeFromInit >= ((15 * 365 days) / 10)) {  
    rebaseRate = 9858898;  
} else if (deltaTimeFromInit >= (7 * 365 days)) {  
    rebaseRate = 4929449;  
}
```

Recommendation

The algorithm should be reshaped so it will match to the business logic.

MTS - Manipulate Total Supply

Criticality	minor
Location	contract.sol#L721

Description

Owner is able to manipulate total supply. This change will have a direct impact on the token price and Market Cap.

```
for (uint256 i = 0; i < times; i++) {  
    _totalSupply = _totalSupply  
        .mul((10**RATE_DECIMALS).add(rebaseRate))  
        .div(10**RATE_DECIMALS);  
}
```

Recommendation

The contract owner should carefully manage the adjustment of the circulating supply (increases or decreases), according to the token's price fluctuations.

L01 - Public Function could be Declared External

Criticality

minor

Location

contract.sol#L521,534,539,565,569,573,1154

Description

Public functions that are never called by the contract should be declared external to save gas.

```
getLiquidityBacking  
decimals  
symbol  
name  
transferOwnership  
renounceOwnership  
owner
```

Recommendation

Use the external attribute for functions never called from the contract.

L02 - State Variables could be Declared Constant

Criticality

minor

Location

contract.sol#L611,624,612,604,609,600,602,603,622,601,371

Description

Constant state variables should be declared constant to save gas.

```
dividendsPerShareAccuracyFactor
treasuryFee
swapEnabled
sellFee
safuDividendFee
liquidityFee
feeDenominator
autofirePitFee
ZERO
...
```

Recommendation

Add the constant attribute to state variables that never change.

L04 - Conformance to Solidity Naming Conventions

Criticality	minor
Location	contract.sol#L153,154,171,191,393,347,355,1023,1032,1095,1110,1135,1136,1137,1164,1168,1173,586,611,612,624,649,650,651,652,653,654

Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow `_` at the beginning of the `mixed_case` match for private variables and unused parameters.

```
_totalSupply  
_lastAddLiquidityTime  
_lastRebasedTime  
_initRebaseStartTime  
_autoAddLiquidity  
_autoRebase  
TwentyFourHours  
ZERO  
DEAD  
...
```

Recommendation

Follow the Solidity naming convention.

<https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions>

L05 - Unused State Variable

Criticality

minor

Location

contract.sol#L20

Description

There are segments that contain unused state variables.

```
MAX_INT256
```

Recommendation

Remove unused state variables.

L07 - Missing Events Arithmetic

Criticality

minor

Location

contract.sol#L393,1143,1148

Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
maxSellPerDay = newMaxSellPerDay  
transferTax = newTransferTax  
minPeriod = _minPeriod
```

Recommendation

Emit an event for critical parameter changes.

L08 - Tautology or Contradiction

Criticality

minor

Location

contract.sol#L1143

Description

Detects expressions that are tautologies or contradictions. For instance, an uint variable will always be greater than or equal to zero.

```
require(bool,string)(newTransferTax >= 0,AlphaPro: Minimum Transfer Tax Is 0%)
```

Recommendation

Fix the incorrect comparison by changing the value type or the comparison.

L09 - Dead Code Elimination

Criticality

minor

Location

contract.sol#L48

Description

Functions that are not used in the contract, and make the code's size bigger.

```
abs
```

Recommendation

Remove unused functions.

L13 - Divide before Multiply Operation

Criticality

minor

Location

contract.sol#L703,843,1154

Description

Performing divisions before multiplications may cause lose of prediction.

```
liquidityBalance = _gonBalances[pair].div(_gonsPerFragment)
_gonBalances[autoLiquidityReceiver] =
_gonBalances[autoLiquidityReceiver].add(gonAmount.div(feeDenominator).mul(liquidityFee))
_gonBalances[address(this)] =
_gonBalances[address(this)].add(gonAmount.div(feeDenominator).mul(_treasuryFee.add(safuDividendFee)))
_gonBalances[autofirePit] =
_gonBalances[autofirePit].add(gonAmount.div(feeDenominator).mul(autofirePitFee))
feeAmount = gonAmount.div(feeDenominator).mul(_totalFee)
times = deltaTime.div(1800)
```

Recommendation

The multiplications should be prior to the divisions.

L14 - Uninitialized Variables in Local Scope

Criticality

minor

Location

contract.sol#L706

Description

There are variables that are defined in the local scope and are not initialized.

```
rebaseRate
```

Recommendation

All the local scoped variables should be initialized.

There is no public billing information, the creator is protected by the privacy settings.

Summary

There are some functions that can be abused by the owner like limiting transactions, transferring tokens to the team's wallet and manipulating fees. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

About Cyberscope

Coinscope audit and K.Y.C. service has been rebranded to Cyberscope.

Coinscope is the leading early coin listing, voting and auditing authority firm. The audit process is analyzing and monitoring many aspects of the project. That way, it gives the community a good sense of security using an informative report and a generic score.

Cyberscope and Coinscope are aiming to make crypto discoverable and efficient globally. They provide all the essential tools to assist users draw their own conclusions.

The Cyberscope team
