## Analysis

Critical
 Medium
 Minor / Informative
 Pass

| Severity | Code | Description                        | Status     |
|----------|------|------------------------------------|------------|
| •        | ST   | Stops Transactions                 | Passed     |
| •        | OCTD | Transfers Contract's Tokens        | Passed     |
| •        | OTUT | Transfers User's Tokens            | Passed     |
| •        | ELFM | Exceeds Fees Limit                 | Passed     |
| •        | ULTW | Transfers Liquidity to Team Wallet | Passed     |
| •        | MT   | Mints Tokens                       | Unresolved |
| •        | ВТ   | Burns Tokens                       | Passed     |
| •        | ВС   | Blacklists Addresses               | Passed     |

## MT - Mints Tokens

| Criticality | Minor / Informative        |
|-------------|----------------------------|
| Location    | contracts/INCToken.sol#L32 |
| Status      | Unresolved                 |

#### Description

The contract owner has the authority to mint 10% of the totalSupply per year. The owner may take advantage of it by calling the mint function. As a result, the contract tokens will be highly inflated.

```
function mint(address to, uint256 amount) external onlyOwner {
  require(
    amount <= (totalSupply() * mintCapacity) / 100,
    "INCToken: mint exceeds maximum amount"
);
  require(block.timestamp >= nextMint, "INCToken: cannot mint yet");

nextMint = block.timestamp + mintInterval;
  _mint(to, amount);
}
```

#### Recommendation

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

## Diagnostics

CriticalMediumMinor / Informative

| Severity | Code | Description                                | Status     |
|----------|------|--|------------|
| •        | L02  | State Variables could be Declared Constant | Unresolved |
| •        | L05  | Unused State Variable                      | Unresolved |
| •        | L12  | Using Variables before Declaration         | Unresolved |
| •        | L13  | Divide before Multiply Operation           | Unresolved |
| •        | L14  | Uninitialized Variables in Local Scope     | Unresolved |
| •        | L15  | Local Scope Variable Shadowing             | Unresolved |
| •        | L17  | Usage of Solidity Assembly                 | Unresolved |
| •        | L04  | Conformance to Solidity Naming Conventions | Unresolved |
| •        | L09  | Dead Code Elimination                      | Unresolved |
| •        | L19  | Stable Compiler Version                    | Unresolved |

## L02 - State Variables could be Declared Constant

| Criticality | Minor / Informative  |
|-------------|--|
| Location    | @openzeppelin/contracts/token/ERC20/extensions/draft-ERC20Permit.sol#L37 |
| Status      | Unresolved   |

## Description

State variables can be declared as constant using the constant keyword. This means that the value of the state variable cannot be changed after it has been set. Additionally, the constant variables decrease gas consumption of the corresponding transaction.

```
bytes32 private _PERMIT_TYPEHASH_DEPRECATED_SLOT
```

#### Recommendation

Constant state variables can be useful when the contract wants to ensure that the value of a state variable cannot be changed by any function in the contract. This can be useful for storing values that are important to the contract's behavior, such as the contract's address or the maximum number of times a certain function can be called. The team is advised to add the constant keyword to state variables that never change.

## L05 - Unused State Variable

| Criticality | Minor / Informative  |
|-------------|--|
| Location    | @openzeppelin/contracts/token/ERC20/extensions/draft-ERC20Permit.sol#L37 |
| Status      | Unresolved   |

#### Description

An unused state variable is a state variable that is declared in the contract, but is never used in any of the contract's functions. This can happen if the state variable was originally intended to be used, but was later removed or never used.

Unused state variables can create clutter in the contract and make it more difficult to understand and maintain. They can also increase the size of the contract and the cost of deploying and interacting with it.

bytes32 private \_PERMIT\_TYPEHASH\_DEPRECATED\_SLOT

#### Recommendation

To avoid creating unused state variables, it's important to carefully consider the state variables that are needed for the contract's functionality, and to remove any that are no longer needed. This can help improve the clarity and efficiency of the contract.

## L12 - Using Variables before Declaration

| Criticality | Minor / Informative  |
|-------------|--|
| Location    | @openzeppelin/contracts/token/ERC20/extensions/ERC20Votes.sol#L228 |
| Status      | Unresolved   |

## Description

The contract is using a variable before the declaration. This is usually happening either if it has not been declared yet or if the variable has been declared in a different scope. It is not a good practice to use a local variable before it has been declared.

```
uint256 newWeight
uint256 oldWeight
```

#### Recommendation

By declaring local variables before using them, contract ensures that it operates correctly. It's important to be aware of this rule when working with local variables, as using a variable before it has been declared can lead to unexpected behavior and can be difficult to debug.

## L13 - Divide before Multiply Operation

| Criticality | Minor / Informative   |
|-------------|---|
| Location    | @openzeppelin/contracts/utils/math/Math.sol#L102,105,117,121,122,123,124,125, 126,132 |
| Status      | Unresolved  |

## Description

It is important to be aware of the order of operations when performing arithmetic calculations. This is especially important when working with large numbers, as the order of operations can affect the final result of the calculation. Performing divisions before multiplications may cause loss of prediction.

```
prod0 := div(prod0, twos)
result = prod0 * inverse
```

#### Recommendation

To avoid this issue, it is recommended to carefully consider the order of operations when performing arithmetic calculations in Solidity. It's generally a good idea to use parentheses to specify the order of operations. The basic rule is that the multiplications should be prior to the divisions.

## L14 - Uninitialized Variables in Local Scope

| Criticality | Minor / Informative  |
|-------------|--|
| Location    | @openzeppelin/contracts/token/ERC20/extensions/ERC20Votes.sol#L233 |
| Status      | Unresolved   |

## Description

Using an uninitialized local variable can lead to unpredictable behavior and potentially cause errors in the contract. It's important to always initialize local variables with appropriate values before using them.

```
uint256 oldWeight
uint256 newWeight
```

#### Recommendation

By initializing local variables before using them, the contract ensures that the functions behave as expected and avoid potential issues.

## L15 - Local Scope Variable Shadowing

| Criticality | Minor / Informative   |
|-------------|---|
| Location    | contracts/INCToken.sol#L21 @openzeppelin/contracts/token/ERC20/extensions/draft-ERC20Permit.sol#L44 |
| Status      | Unresolved  |

## Description

Local scope variable shadowing occurs when a local variable with the same name as a variable in an outer scope is declared within a function or code block. When this happens, the local variable "shadows" the outer variable, meaning that it takes precedence over the outer variable within the scope in which it is declared.

```
nt256 totalSupply
string memory name
```

#### Recommendation

It's important to be aware of shadowing when working with local variables, as it can lead to confusion and unintended consequences if not used correctly. It's generally a good idea to choose unique names for local variables to avoid shadowing outer variables and causing confusion.

## L17 - Usage of Solidity Assembly

| Criticality | Minor / Informative   |
|-------------|---|
| Location    | @openzeppelin/contracts/utils/Strings.sol#L24 @openzeppelin/contracts/utils/math/Math.sol#L66 @openzeppelin/contracts/utils/cryptography/ECDSA.sol#L63 @openzeppelin/contracts/token/ERC20/extensions/ERC20Votes.sol#L267 |
| Status      | Unresolved  |

## Description

Using assembly can be useful for optimizing code, but it can also be error-prone. It's important to carefully test and debug assembly code to ensure that it is correct and does not contain any errors.

Some common types of errors that can occur when using assembly in Solidity include Syntax, Type, Out-of-bounds, Stack, and Revert.

#### Recommendation

It is recommended to use assembly sparingly and only when necessary, as it can be difficult to read and understand compared to Solidity code.

## L04 - Conformance to Solidity Naming Conventions

| Criticality | Minor / Informative           |
|-------------|-------------------------------|
| Location    | contracts/INCToken.sol#L16,17 |
| Status      | Unresolved                    |

#### Description

The Solidity style guide is a set of guidelines for writing clean and consistent Solidity code. Adhering to a style guide can help improve the readability and maintainability of the Solidity code, making it easier for others to understand and work with.

The followings are a few key points from the Solidity style guide:

- 1. Use camelCase for function and variable names, with the first letter in lowercase (e.g., myVariable, updateCounter).
- 2. Use PascalCase for contract, struct, and enum names, with the first letter in uppercase (e.g., MyContract, UserStruct, ErrorEnum).
- 3. Use uppercase for constant variables and enums (e.g., MAX\_VALUE, ERROR\_CODE).
- 4. Use indentation to improve readability and structure.
- 5. Use spaces between operators and after commas.
- 6. Use comments to explain the purpose and behavior of the code.
- 7. Keep lines short (around 120 characters) to improve readability.

```
nt256 public constant mintInterval = 365 days;
nt256 public constant mintCapacity = 10;
```

#### Recommendation

By following the Solidity naming convention guidelines, the codebase increased the readability, maintainability, and makes it easier to work with.

Find more information on the Solidity documentation https://docs.soliditylang.org/en/v0.8.17/style-guide.html#naming-convention.

## L09 - Dead Code Elimination

| Criticality | Minor / Informative        |
|-------------|----------------------------|
| Location    | contracts/INCToken.sol#L60 |
| Status      | Unresolved                 |

#### Description

In Solidity, dead code is code that is written in the contract, but is never executed or reached during normal contract execution. Dead code can occur for a variety of reasons, such as:

- Conditional statements that are always false.
- Functions that are never called.
- Unreachable code (e.g., code that follows a return statement).

Dead code can make a contract more difficult to understand and maintain, and can also increase the size of the contract and the cost of deploying and interacting with it.

```
nction _burn(
    address account,
    uint256 amount
) internal override(ERC20, ERC20Votes) {
    super._burn(account, amount);
}
```

#### Recommendation

To avoid creating dead code, it's important to carefully consider the logic and flow of the contract and to remove any code that is not needed or that is never executed. This can help improve the clarity and efficiency of the contract.

## L19 - Stable Compiler Version

| Criticality | Minor / Informative       |
|-------------|---------------------------|
| Location    | contracts/INCToken.sol#L2 |
| Status      | Unresolved                |

#### Description

The ^ symbol indicates that any version of Solidity that is compatible with the specified version (i.e., any version that is a higher minor or patch version) can be used to compile the contract. The version lock is a mechanism that allows the author to specify a minimum version of the Solidity compiler that must be used to compile the contract code. This is useful because it ensures that the contract will be compiled using a version of the compiler that is known to be compatible with the code.

```
pragma solidity ^0.8.0;
```

#### Recommendation

The team is advised to lock the pragma to ensure the stability of the codebase. The locked pragma version ensures that the contract will not be deployed with an unexpected version. An unexpected version may produce vulnerabilities and undiscovered bugs. The compiler should be configured to the lowest version that provides all the required functionality for the codebase. As a result, the project will be compiled in a well-tested LTS (Long Term Support) environment.

## **Functions Analysis**

| Contract | Туре               | Bases                                     |            |           |
|----------|--------------------|---|------------|-----------|
|          | Function Name      | Visibility                                | Mutability | Modifiers |
|          |                    |   |            |           |
| Ownable  | Implementation     | Context                                   |            |           |
|          |                    | Public                                    | 1          | -         |

## Inheritance Graph

## Flow Graph

## Summary

There are some functions that can be abused by the owner like mint tokens. if the contract owner abuses the mint functionality, then the contract will be highly inflated. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.

This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes nor may copies be delivered to any other person other than the Company without Cyberscope's prior written consent. This report is not nor should be considered an "endorsement" or "disapproval" of any particular project or team. This report is not nor should be regarded as an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Cyberscope to perform a security assessment. This document does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors' business, business model or legal compliance. This report should not be used in any way to make decisions around investment or involvement with any particular project. This report represents an extensive assessment process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk Cyberscope's position is that each company and individual are responsible for their own due diligence and continuous security Cyberscope's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies and in no way claims any guarantee of security or functionality of the technology we agree to analyze. The assessment services provided by Cyberscope are subject to dependencies and are under continuing development. You agree that your access and/or use including but not limited to any services reports and materials will be at your sole risk on an as-is where-is and as-available basis Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives false negatives and other unpredictable results. The services may access and depend upon multiple layers of third parties.

## About Cyberscope

Cyberscope is a blockchain cybersecurity company that was founded with the vision to make web3.0 a safer place for investors and developers. Since its launch, it has worked with thousands of projects and is estimated to have secured tens of millions of investors' funds.

Cyberscope is one of the leading smart contract audit firms in the crypto space and has built a high-profile network of clients and partners.
