| Corrected Phase 3 | 6th December 2022   |

## **Contract Architecture**

The contract implements an ERC20 token enriched with some features like reflections and autogenerated liquidity pool. The implementation of the contract is custom and it is not based on any well-known implementation. As a result, some concepts and methodologies like <u>allowance</u>, <u>reflections</u>, <u>gas optimization</u>, etc. could be more well-structured. The team is advised to fork a well-known ERC20 implementation that contains the same features and apply their requirements.

### Team's Reply 29 November 2022

The team has acknowledged that this is not a security issue and states:

"We are not using Safemoon-fork reflections system cause:

- 1. It is expensive in terms of gas too.
- 2. It is harder to implement considering we have a different method of share calculations.
- 3. So all gas optimizations are targeted mainly to compensate costly reflections system."

#### Team's Update 14 December 2022

"7.5% locked for liquidity injection. Liquidity gathered from fees can be unlocked but we have a separate lock mechanism for that again in the contract."

# **Contract Analysis**

CriticalMediumMinor / Informative

| Severity | Code | Description                                | Status       |
|----------|------|--|--------------|
| •        | TSD  | Total Supply Diversion                     | Acknowledged |
| •        | RLS  | Redundant Liquidity Swaps                  | Acknowledged |
| •        | RM   | Reflection Mechanism                       | Acknowledged |
| •        | L04  | Conformance to Solidity Naming Conventions | Acknowledged |

## TSD - Total Supply Diversion

| Criticality | medium             |
|-------------|--------------------|
| Location    | contract.sol#L1158 |
| Status      | Acknowledged       |

#### Description

The amount that is added to the total supply does not equal the amount that is added to the balances. As a result, the sum of balances is diverse from the total supply.

```
_balanceOf[account] += _reflected;
```

#### Recommendation

The sum of balances should always be equal to the total supply.

#### Team's Reply 29 November 2022

The team has acknowledged that this is not a security issue and states:

"This amount is deducted from the total supply in notifyTaxSystem() then its continuously being added here until reflection cycle is finished while it is true that the sum of all balances won't be equal to the total supply in most cases in the end, they will become equal (minus some small amount as a result of rounding down on divisions) but sum of all balances will not ever be greater than total supply so your comment that "The amount that is added to the total supply does not equal the amount that is added to the balances" is not true because tokens here are not actually being minted or added to the total supply but as stated in a comment above it is true that sum of all balances will be slightly lower than total supply presonally I do not think this is a major issue."

## RLS - Redundant Liquidity Swaps

| Criticality | minor / informative     |
|-------------|-------------------------|
| Location    | contract.sol#L1318,1339 |
| Status      | Acknowledged            |

#### Description

In order to accumulate tokenLiquidityReserves the contract swap tokens for BNB and then swap back the proportional BNB for tokens.

```
function addLiquidityFromTokenReserves() private
    uint80 liquidityPotBefore = potsBNB.liquidity;
    potsBNB.liquidity = 0;
    (uint256 addedTokens, uint256 addedBNB,) =
SwapRouter.addLiquidityETH{value: liquidityPotBefore - 1}(
            address(this),
            tokenLiquidityReserves,
            0,
            0,
            address(this),
            block.timestamp
        );
    unchecked
    {
        potsBNB.liquidity = liquidityPotBefore - uint80(addedBNB);
        tokenLiquidityReserves -= addedTokens;
}
```

```
function refillLiquidityTokenReserves() private
{
    unchecked
    {
        uint256 amountBNBtoBeSwapped = potsBNB.liquidity / 2;
        potsBNB.liquidity -= uint80(amountBNBtoBeSwapped);

        uint256 swappedTokens = swapBNBForTokens(amountBNBtoBeSwapped);
        tokenLiquidityReserves += swappedTokens;
    }
}
```

#### Recommendation

The contract could accumulate the tokens directly from the liquidity fees.

#### Team's Reply 29 November 2022

The team has acknowledged that this is not a security issue and states:

"Initially tokenLiquidityReserves is filled so no reduntant swaps then after some time it is true that redundant swap are gonna happen, but:

- 1. it saves just a little bit of gas to not write to tokenLiquidityReserves on every taxed tx
- 2. it is not useful to write every time to tokenLiquidityReserves as initially it is filled

we were planning to fill it after deployment but it is surely more reasonable to do it here that way instead of using 50/50 system we forward 100% bnb from tax to liquidity and it works while tokenLiquidityReserves is filled not as a result of a swap."

## RM - Reflection Mechanism

| Criticality | minor / informative   |
|-------------|-----------------------|
| Location    | contract.sol#L862,866 |
| Status      | Acknowledged          |

#### Description

The contract uses a complicated technique to send the reflected tokens to each account. On every transfer, the sender's and the receiver's balance is updated according to the corresponding reflected amount. This process produces a large amount of gas cost proportionally to the number of transfers.

```
updateReflections(sender);
...
updateReflections(recipient);
```

#### Recommendation

The contract could use a simpler reflections mechanism that is based on a classic safemoon fork.

https://github.com/safemoonprotocol/Safemoon.sol/blob/main/Safemoon.sol

#### Team's Reply 29 November 2022

The team has acknowledged that this is not a security issue.

The team response is mentioned in the **Contract Architecture** section.

# L04 - Conformance to Solidity Naming Conventions

| Criticality | minor / informative                                    |
|-------------|--|
| Location    | More.sol#L119,62,134,189,191,115,97,193,118,58,192,121 |
| Status      | Acknowledged   |

#### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

AuthorizedContracts
\_totalSupply
Taxes
SwapRouter
SwapAgent
ReflectionsPerSharePaid
Modifiers
Agent
Shareholders

#### Recommendation

Follow the Solidity naming convention.

https://docs.soliditylang.org/en/v0.8.17/style-guide.html#naming-conventions.

## Team Update 29 November 2022

The team has acknowledged that this is not a security issue.

## **Contract Functions**

The domain was created 5 months before the creation of the audit. It will expire in 8 months.

There is no public billing information, the creator is protected by the privacy settings.

## Summary

The Mythic Ore contract implements an ERC20 token. This audit investigates security issues, business logic concerns and potential improvements.

#### Team Update 29 November 2022

The team has replied to all of the findings and has acknowledged that the remaining are not security issues.

#### Team's Update 14 December 2022

"7.5% locked for liquidity injection. Liquidity gathered from fees can be unlocked but we have a separate lock mechanism for that again in the contract."

## Disclaimer

The information provided in this report does not constitute investment, financial or trading advice and you should not treat any of the document's content as such. This report may not be transmitted, disclosed, referred to or relied upon by any person for any purposes nor may copies be delivered to any other person other than the Company without Cyberscope's prior written consent. This report is not nor should be considered an "endorsement" or "disapproval" of any particular project or team. This report is not nor should be regarded as an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Cyberscope to perform a security assessment. This document does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors' business, business model or legal compliance. This report should not be used in any way to make decisions around investment or involvement with any particular project. This report represents an extensive assessment process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

Blockchain technology and cryptographic assets present a high level of ongoing risk Cyberscope's position is that each company and individual are responsible for their own due diligence and continuous security Cyberscope's goal is to help reduce the attack vectors and the high level of variance associated with utilizing new and consistently changing technologies and in no way claims any guarantee of security or functionality of the technology we agree to analyze. The assessment services provided by Cyberscope are subject to dependencies and are under continuing development. You agree that your access and/or use including but not limited to any services reports and materials will be at your sole risk on an as-is where-is and as-available basis Cryptographic tokens are emergent technologies and carry with them high levels of technical risk and uncertainty. The assessment reports could include false positives false negatives and other unpredictable results. The services may access and depend upon multiple layers of third parties.

# About Cyberscope

Cyberscope is a blockchain cybersecurity company that was founded with the vision to make web3.0 a safer place for investors and developers. Since its launch, it has worked with thousands of projects and is estimated to have secured tens of millions of investors' funds.

Cyberscope is one of the leading smart contract audit firms in the crypto space and has built a high-profile network of clients and partners.
