# **Audit Updates**

| Initial Audit | 29th April 2022 |
|---------------|-----------------|
| Corrected     |                 |

# **Contract Analysis**

CriticalMediumMinorPass

| Severity | Code | Description   |
|----------|------|---|
| •        | ST   | Contract Owner is not able to stop or pause transactions  |
| •        | OCTD | Contract Owner is not able to transfer tokens from specific address   |
| •        | OTUT | Owner Transfer User's Tokens  |
| •        | ELFM | Contract Owner is not able to increase fees more than a reasonable percent (25%)                                  |
| •        | ULTW | Contract Owner is not able to increase the amount of liquidity taken by dev wallet more than a reasonable percent |
| •        | MT   | Contract Owner is not able to mint new tokens   |
| •        | ВТ   | Contract Owner is not able to burn tokens from specific wallet  |
| •        | ВС   | Contract Owner is not able to blacklist wallets from selling  |

#### ST - Stop Transactions

| Criticality | medium             |
|-------------|--------------------|
| Location    | contract.sol#L1048 |

#### Description

The contract owner has the authority to stop transactions for all users excluding the owner. The owner may take advantage of it by setting the \_maxTxAmount to zero.

#### Recommendation

The contract could embody a check for not allowing setting the \_maxTxAmount less than a reasonable amount. A suggested implementation could check that the minimum amount should be more than a fixed percentage of the total supply.

The team should carefully manage the private keys of the owner's account. We strongly recommend a powerful security mechanism that will prevent a single user from accessing the contract admin functions. That risk can be prevented by temporarily locking the contract or renouncing ownership.

# **Contract Diagnostics**

CriticalMediumMinor

| Severity | Code | Description                                |
|----------|------|--|
| •        | FSA  | Fixed Swap Address                         |
| •        | MAL  | Misused Algorithmic Logic                  |
| •        | CO   | Code Optimization                          |
| •        | L01  | Public Function could be Declared External |
| •        | L02  | State Variables could be Declared Constant |
| •        | L04  | Conformance to Solidity Naming Conventions |
| •        | L07  | Missing Events Arithmetic                  |
| •        | L09  | Dead Code Elimination                      |
| •        | L13  | Divide before Multiply Operation           |

#### FSA - Fixed Swap Address

| Criticality | minor             |
|-------------|-------------------|
| Location    | contract.sol#L740 |

#### Description

The swap address is assigned once in the constructor and it can not be changed. The decentralized swaps sometimes create a new swap version or abandon the current. A contract that cannot change the swap address may not be able to catch-up the upgrade.

```
IUniswapV2Router02 _uniswapV2Router =
IUniswapV2Router02(0x10ED43C718714eb63d5aA57B78B54704E256024E);
    // Create a uniswap pair for this new token
    uniswapV2Pair = IUniswapV2Factory(_uniswapV2Router.factory())
    .createPair(address(this), _uniswapV2Router.WETH());
    // set the rest of the contract variables
    uniswapV2Router = _uniswapV2Router;
```

#### Recommendation

It could be better to allow the swap address mutation in case of future swap updates.

#### MAL - Misused Algorithmic Logic

| Criticality | critical          |
|-------------|-------------------|
| Location    | contract.sol#L924 |

#### Description

The algorithmic flow does not follow the required business logic. In the following code segment, the rFee is changed (subtraction) before they are removed from the \_rTotal. So, the \_rTotal will be reduced by a percentage amount instead of the current total fees. As a result, the value of the \_rTotal will be bigger than the actual total supply.

```
uint256 _rtotransferrteam = ronePart.mul(transferTeamfee);
                uint256 _ttotransferrteam = tonePart.mul(transferTeamfee);
                rFee = rFee.sub(_rtotransferrteam);
                tFee = tFee.sub(_ttotransferrteam);
                uint256 _rtotransferrburn = ronePart.mul(burnDivisor);
                uint256 _ttotransferrburn = tonePart.mul(burnDivisor);
                rFee = rFee.sub(_rtotransferrburn);
                tFee = tFee.sub(_ttotransferrburn);
                uint256 _rtotransferrcharity = ronePart.mul(charityDivisor);
                uint256 _ttotransferrcharity = tonePart.mul(charityDivisor);
                rFee = rFee.sub(_rtotransferrcharity);
                tFee = tFee.sub(_ttotransferrcharity);
                _takefunds(teamAddress,_rtotransferrteam,_ttotransferrteam);
                _takefunds(deadAddress,_rtotransferrburn,_ttotransferrburn);
_takefunds(airdropAddress,_rtotransferrcharity,_ttotransferrcharity);
            _rTotal = _rTotal.sub(rFee);
            _tFeeTotal = _tFeeTotal.add(tFee);
```

#### Recommendation

The algorithm should be reshaped so it will match to the business logic.

### CO - Code Optimization

```
Criticality minor

Location contract.sol#L702, 911, 1081, 1246, 1252
```

#### Description

There are code segments that could be optimized. A segment may be optimized so that it becomes a smaller size, consumes less memory, executes more rapidly, or performs fewer operations. teamDivisor is fixed to 0 so the calculation will always return 0.

```
uint256 public teamDivisor = 0;
```

```
uint256 _rtotransferrteam = ronePart.mul(teamDivisor);
uint256 _ttotransferrteam = tonePart.mul(teamDivisor);
rFee = rFee.sub(_rtotransferrteam);
tFee = tFee.sub(_ttotransferrteam);
```

Contract owner has the authority to manipulate the fees by calling the setTaxFeePercent and setLiquidityFeePercent functions. But, the fees are set through \_transfer function on each transaction.

```
function setSellFee() internal {
    isSell = true;
    _taxFee = 9;
    _liquidityFee = 6;
}
```

```
function setTransferFee() internal {
    isSell = false;
    _taxFee = 4;
    _liquidityFee = 1;
}
```

#### Recommendation

Rewrite some code segments so the runtime will be more performant.

#### L01 - Public Function could be Declared External

| Criticality | minor   |
|-------------|---|
| Location    | contract.sol#L433,442,754,758,762,766,775,780,784,789 and 11 more |

#### Description

Public functions that are never called by the contract should be declared external to save gas.

isExcludedFromFee
setSwapAndLiquifyEnabled
includeInFee
excludeFromFee
excludeFromReward
reflectionFromToken
deliver
totalFees
isExcludedFromReward
....

#### Recommendation

Use the external attribute for functions never called from the contract

#### L02 - State Variables could be Declared Constant

| Criticality | minor  |
|-------------|--|
| Location    | contract.sol#L691,689,690,685,708,706,705,704,707,703 and 2 more |

#### Description

Constant state variables should be declared constant to save gas.

transferTeamfee
teamDivisor
sellliquiduty
marketingDivisor
farmstakingDivisor
ecosystemDivisor
charityDivisor
burnDivisor
\_tTotal
...

#### Recommendation

Add the constant attribute to state variables that never change.

# L04 - Conformance to Solidity Naming Conventions

| Criticality | minor   |
|-------------|---|
| Location    | contract.sol#L486,487,504,526,897,1001,1007,1220,1224,1228 and 6 more |

#### Description

Solidity defines a naming convention that should be followed. Rule exceptions:

- Allow constant variable name/symbol/decimals to be lowercase.
- Allow \_ at the beginning of the mixed\_case match for private variables and unused parameters.

```
_maxTxAmount
_liquidityFee
_taxFee
_selltokenswap
_farmsstakingAddress
_teamAddress
_airdropAddress
_foundation
_marketingAddress
...
```

#### Recommendation

Follow the Solidity naming convention.

https://docs.soliditylang.org/en/v0.4.25/style-guide.html#naming-conventions

# L07 - Missing Events Arithmetic

| Criticality | minor                               |
|-------------|-------------------------------------|
| Location    | contract.sol#L881,886,891,1239,1242 |

#### Description

Detected missing events for critical arithmetic parameters. There are functions that have no event emitted, so it is difficult to track off-chain changes.

```
_maxTxAmount = maxTxAmount
numTokensSellToAddToLiquidity = _selltokenswap
_maxTxAmount = _tTotal.mul(maxTxPercent).div(10 ** 2)
_liquidityFee = liquidityFee
_taxFee = taxFee
```

#### Recommendation

Emit an event for critical parameter changes.

#### L09 - Dead Code Elimination

| Criticality | minor                                     |
|-------------|---|
| Location    | contract.sol#L361,321,331,346,356,268,295 |

#### Description

Functions that are not used in the contract, and make the code's size bigger.

sendValue isContract functionCallWithValue functionCall \_functionCallWithValue

#### Recommendation

Remove unused functions.

# L13 - Divide before Multiply Operation

| Criticality | minor                             |
|-------------|-----------------------------------|
| Location    | contract.sol#L905,1095 and 6 more |

#### Description

Performing divisions before multiplications may cause lose of prediction.

```
convertbaltoone = newBalance.div(5)
onepartliqudity = contractTokenBalance.div(_liquidityFee)
tonePart = tFee.div(_taxFee)
ronePart = rFee.div(_taxFee)
...
```

#### Recommendation

The multiplications should be prior to the divisions.

# **Contract Functions**

| Contract | Туре                  | Bases      |            |           |
|----------|-----------------------|------------|------------|-----------|
|          | Function Name         | Visibility | Mutability | Modifiers |
|          |                       |            |            |           |
| IERC20   | Interface             |            |            |           |
|          | totalSupply           | External   |            | -         |
|          | balanceOf             | External   |            | -         |

The domain has been created 4 months before the creation of the audit. It will expire in 8 months.

There is no public billing information, the creator is protected by the privacy settings.

# Summary

There are some functions that can be abused by the owner, like stopping transactions for everyone else other than the owner. The contract is also using a reflection technique that manipulates the total supply in a wrong way. The fees are fixed to 15% on selling and 5% on buying. A multi-wallet signing pattern will provide security against potential hacks. Temporarily locking the contract or renouncing ownership will eliminate all the contract threats.
